COVENANT

COLLATERAL BUYS 1X.
COVENANTS BUY THE REST.

*Under-collateralized credit on Creditcoin, enforced by proofs from
Ethereum.*

LIVE ON CREDITCOIN TESTNET

ATTESTCOIN PROTOCOL

ON-CHAIN CREDIT, TODAY

A RÉSUMÉ, NOT A CREDIT REPORT

FAILURE MODE A

OVER-COLLATERALIZED

Capital sits idle to cover downside. Safe, but it can't fund growth — borrowers pay for risk they aren't taking.

FAILURE MODE B

OFF-CHAIN TRUST

Underwriting moves behind closed doors. Fast, but it reintroduces the counterparty risk on-chain credit was built to remove.

The new wave of "prove your history" credit scores has a structural flaw: **the borrower chooses which transactions to prove**. Inclusion proofs can show something happened — they can never show that something didn't.

That's a résumé, not a credit report.

HOW BANKS ACTUALLY UNDERWRITE

LEND ON COVENANTS, NOT RÉSUMÉS

*Banks don't lend on résumés. They lend on covenants — promises that turn risk
into observable events.*

CROSS-DEFAULT

DEBT INCURRENCE

NEGATIVE PLEDGE

A breach is a positive event — so anyone can prove it.

FROM BOND TO BREACH TO SETTLEMENT

HOW IT WORKS

1

Post & Link

Borrower posts a bond in tCTC and links an Ethereum wallet with an EIP-712 signature.

2

Choose Covenants

CROSS_DEFAULT (no Aave liquidation), DEBT_CAP (borrow ceiling), NEGATIVE_PLEDGE (no large token outflow).

3

Breach & Freeze

Anyone who sees a breach on Ethereum submits it with an Attestcoin inclusion proof; the precompile verifies it same-transaction; the line freezes; the reporter earns 10% of the bond.

4

Cure or Settle

Borrower cures by proving repayment within the grace period — or anyone settles the default and the bond goes to LPs.

THE FORMULA

LIMIT SCALES WITH PROMISES KEPT

$$\text{LIMIT} = \text{BOND} \times (1 + \text{COVENANT WEIGHTS} + \text{HISTORY BOOST}) \cdot \text{HARD CAP } 4\times$$

- Cross-default — **+1.00×**
- Debt cap — **+0.75×**
- Negative pledge — **+0.50×**
- Each proven Aave repayment — **+0.25×** (max +1.00×

Live example

Bond 400 tCTC

Limit 1,600 tCTC

Drawn 1,000 tCTC (40% collateral)

ONE PROTOCOL, FOUR USES

THE ATTESTCOIN PROTOCOL

A

IMPORT HISTORY

Batch inclusion proofs import repayment history — 4 real Aave Sepolia repays verified in one call to the precompile's batch overload.

B

REPORT BREACHES

Single inclusion proofs report a covenant breach the moment it happens on Ethereum.

C

CURE BREACHES

Proofs of repayment cure an active breach within the grace period.

D

ANCHOR TIME

The ChainInfo precompile anchors each covenant to the attested source height at signing — old events can never be used against a new line.

Plus a zero-gas `previewBreach` that checks a real Ethereum mainnet Aave liquidation against a covenant. No oracle operators, no relayer trust: emitter binding, receipt-status check, replay keys per (chain, height, tx, log).

EVERY PATH ABOVE REVERTS

FAILURE MODES, ENUMERATED

THE REFUSAL IS THE PRODUCT

- Replayed proof
- Spoofed emitter
- Wrong wallet
- Pre-activation event
- Failed source tx
- Verifier false
- Threshold not exceeded
- Cure after grace

AI RISK MEMO

An optional memo proposes covenant thresholds but can only *tighten*, never loosen: the contract enforces template ceilings and stores only the memo hash.

VERIFICATION

197 Foundry tests, including invariants — pool assets = idle + outstanding, bonds fully backed, limit $\leq 4 \times$ bond — with fixtures from real Ethereum mainnet and Sepolia proofs.

WHY CREDITCOIN

AAVE BECOMES A MONITORING LAYER FOR CREDITCOIN CREDIT

Creditcoin's mission is real-world credit; Attestcoin makes Ethereum's activity legible to Creditcoin without bridges. Covenant turns Ethereum's largest lending market into a source of enforceable promises for credit issued on Creditcoin.

BORROWERS

DeFi-native wallets with Aave history, market makers, DAOs.

LIQUIDITY PROVIDERS

Earn **12% APR** on wrapped tCTC.

WATCHERS

Earn bounties for proving breaches first.

CreditRecord is a portable per-wallet record any Creditcoin app can read.

Live line

- 4 real Aave repays proven in one batch
- 1,000 tCTC drawn on a 400 tCTC bond
- Real Sepolia debt-cap breach proven by a third-party watcher
- Cured by proof of repayment

TypeScript SDK + CLI + web app.

Q4 2026

MAINNET, MORE COVENANTS, A CREDIT PRIMITIVE

- Mainnet launch as Attestcoin mainnet reads expand
- More covenant templates — Morpho, Compound, Spark; health-factor floors; stablecoin reserve covenants
- Covenant-priced tranches (senior / junior) for LPs
- Watcher network with staking
- CreditRecord as a Creditcoin-wide credit primitive

THE ASK

A CEIP PARTNERSHIP TO LAUNCH ON MAINNET WITH AN AUDIT.
